## MATRICES AND TRANSFORMATIONS

A $2 \times 2$ matrix defines a plane transformation under which the origin is invariant.
A transformation which leaves the origin invariant can be represented by a $2 \times 2$ matrix. This means matrices of transformation for reflections in the lines $x=0, y=0, y=x$ and $x=-y$ can be found.
The same applies to the matrices of transformation for rotations about the origin through certain angles.

## TRANSFORMING OBJECTS BY MATRICES OF

TRANSFORMATION.
-The coordinates of a point $(\mathrm{a}, \mathrm{b})$ can be represented by a column matrix as $\binom{a}{b}$.
So if given coordinates of vertices of the object write each in column form in order to form an object coordinates' matrix. -If the transformation matrix is given, always pre-multiply it by the object coordinates' matrix. The product matrix of the two matrices gives the image coordinates' matrix.
-The coordinates of the image can be got by writing the image coordinates' matrix in coordinate form.
i.e. $\binom{$ Transformation }{ matrix }$\binom{$ coordinates' matric }{ for object }$=$ $\binom{$ coordinates, matrix }{ for image }

## Example 1:

Rectangle $A B C D$ has vertices at $A(4,1), B(4,3), C(1,3)$ and $D(1,1)$.

Find its image under the transformationmatrix $\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right)$. Describe the transformation.

Solution:

$$
\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)\left(\begin{array}{llll}
4 & 4 & 1 & 1 \\
1 & 3 & 3 & 1
\end{array}\right)=\left(\begin{array}{cccc}
4 & 4 & 1 & 1 \\
-1 & -3 & -3 & -1
\end{array}\right)
$$

The image rectangle $A^{\prime} B^{\prime} C^{\prime} D^{\prime}$ has vertices at $A^{\prime}(4,-1), B^{\prime}(4,-3)$, $C^{\prime}(1,-3)$ and $D^{\prime}(1,-1)$.

When the image and the object are shown on a Cartesian plane, it indicates that the transformation matrix $\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right)$ is a reflection in the x -axis.

Example 2:
A triangle PQR with vertices $P(-1,2), Q(2,2)$ and $R(2,4)$ undergoes a transformationwith matrix $\left(\begin{array}{cc}0 & -1 \\ -1 & 0\end{array}\right)$ to give triangle $P^{\prime} Q^{\prime} R^{\prime}$. Draw it and its image and describe the transformation.

## Solution:

$$
\left(\begin{array}{lr}
0 & -1 \\
-1 & 0
\end{array}\right)\left(\begin{array}{ccc}
-1 & 2 & 2 \\
2 & 2 & 4
\end{array}\right)=\left(\begin{array}{ccc}
-2 & -2 & -4 \\
1 & -2 & -2
\end{array}\right)
$$

$P^{\prime}(-2,1), Q^{\prime}(-2,-2), R^{\prime}(-4,-2)$.
When the triangles PQR and $P^{\prime} Q^{\prime} R^{\prime}$ are drawn, it shows that the transformation is a reflection in $y=-x$

## Example 3:

Find the image of the unit square OIKJ under the transformation $\left(\begin{array}{ll}2 & 0 \\ 0 & 2\end{array}\right)$. Describe the transformation.

## Solution:

Using
$\binom{$ Transformation }{ matrix }$\binom{$ coordinates' matric }{ for object }$=\binom{$ coordinates' matrix }{ for image }
Determine the image square O'I $^{\prime} \mathrm{K}^{\prime} \mathrm{J}^{\prime}$. Draw both OIKJ and O'I'K'J' on the same pair of axes, then describe the transformation. It is an enlargement, scale factor 2 and center O(0,0)

## Exercise:

Draw the given objects and the corresponding images under the given transformation matrix and hence describe the transformation.
1). Make a capital letter $P$ by joining the points (2,1), (2,2), $(2,3)$, and $(3,2)$. Find the image of the points that make the given letter under the transformation $\left(\begin{array}{cc}-1 & 0 \\ 0 & -1\end{array}\right)$
2). Triangle PQR with vertices $P(1,1) Q(4,1)$ and $R(4,3)$. Matrix of transformation $\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right)$
3). Rectangle $A B C D$ with vertices $A(1,1), B(3,1), C(3,2)$ and $D(1,3)$; transformation matrix $\left(\begin{array}{cc}-2 & 0 \\ 0 & -2\end{array}\right)$
4). Square OIJK with vertices $O(0,0), I(1,0), K(1,1)$ and $J(0,1)$ under matrix $\left(\begin{array}{cc}0 & -1 \\ 1 & 0\end{array}\right)$

The unit square
Example:

Examine the effect of the transformation matrix $\left(\begin{array}{ll}2 & 5 \\ 1 & 1\end{array}\right)$ upon the unit square.

## Solution:

Note: O is invariant, $\mathrm{I}(1,0)$ is mapped onto $\mathrm{I}^{\prime}(2,3)$ and that $\binom{2}{3}$ is the first column in the matrix for the transformation.
What can you notice for $J$ and $J^{\prime} ? J(0,1)$ is mapped onto $J^{\prime}(5,1)$ and that $\binom{5}{1}$ is the second column in the matrix of
transformation. Therefore, if the matrix of transformation is
$\mathrm{A}=\left(\begin{array}{ll}a & c \\ b & d\end{array}\right)$ then,

$$
\left(\begin{array}{ll}
a^{\prime} & c \\
b & d
\end{array}\right)\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)^{\prime \prime}=\left(\begin{array}{ll}
a & c \\
b & d
\end{array}\right)
$$

$$
\mathrm{Al}=\mathrm{A}
$$

Note that, the image coordinates matrix for the unit square gives the matrix of transformation, where the columns for I and $J$ form the identity matrix and the columns for $l$ ' and $J$ for the matrix of transformation.
What kind of quadrilateral is O'I $^{\prime} \mathbf{K}^{\prime} J^{\prime}$ ?
A unit square is used to find the matrix of formation because the images of I and Ji.e. I' and J' when written in column form, gives the columns of matrix of transformation.

## Exercise:

Sketch the image of the unit square under the transformation whose matrix is;
a). $\left(\begin{array}{ll}3 & 1 \\ 1 & 3\end{array}\right)$
b). $\left(\begin{array}{rr}1 & -2 \\ 0 & 1\end{array}\right)$
c). $\left(\begin{array}{ll}2 & 0 \\ 0 & 2\end{array}\right)$
d). $\left(\begin{array}{ll}1 & 1 \\ 1 & 1\end{array}\right)$

Describe the transformation in b). and c).
Does a $2 \times 2$ always map the unit square on a parallelogram?
Finding the matrix of transformation.
The objects I and J are always used since their coordinates matrix form an identity matrix.
i.e. $I A=A I=A$.

## Example:

If $\left(\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right)$ is mapped onto $\left(\begin{array}{rr}1 & -1 \\ 5 & 2\end{array}\right)$, find the matrix of transformation.
Solution: The images of I and $J$ are $(1,5)$ and $(-1,2)$ respectively. This means that the columns of the transformation matrix are $\binom{1}{5}$ and $\binom{-1}{2}$ then the matrix $\left(\begin{array}{cc}1 & -1 \\ 5 & 2\end{array}\right)$

Unit matrix
Image matrix
2). $\left(\begin{array}{llll}0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1\end{array}\right)\left(\begin{array}{rrrr}0 & 1 & 1 & 0 \\ 0 & -1 & 2 & 3\end{array}\right)$
$\left(\begin{array}{ll}a & b \\ c & d\end{array}\right)\left(\begin{array}{llll}0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1\end{array}\right)=\left(\begin{array}{rrrr}0 & O^{\prime} & r^{\prime} & k^{\prime} \\ 0 & -1 & 1 & 0 \\ 0 & -1 & 2 & 3\end{array}\right)$
$\binom{a}{b}=\binom{1}{-1}$ and $\binom{b}{d}=\binom{0}{3}$
Therefore $\left(\begin{array}{ll}a & b \\ c & d\end{array}\right)=\left(\begin{array}{cc}1 & 0 \\ -1 & 3\end{array}\right)$
3). $\left(\begin{array}{cccc}0 & 3 & 7 & 4 \\ 0 & 2 & -1 & -3\end{array}\right)$ Image under the transformation of the unit square.

Exercise: ref, SMEA BK4 pg84.
1). A triangle $A B C$ with vertices $A(1,2), B(-3,5)$ and $C(4,0)$ is mapped onto a triangle $A^{\prime} B^{\prime} C^{\prime}$ with vertices $A^{\prime}(1,8), B^{\prime}(-3,9)$ and $C^{\prime}(4,8)$. Find the matrix of transformation.
2). Find the matrix of transformation which transforms $K(2,1)$ onto $\mathrm{K}^{\prime}(4,5)$ and $\mathrm{L}(-3,5)$ onto $\mathrm{L}^{\prime}(-6,-1)$.

## ROTATION

## Matrices for rotation

Note: The matrix of transformation for rotation about the origin through the angle $\Theta^{\circ}$ is given by
$R=\left(\begin{array}{cc}\cos \theta^{\circ} & -\sin \theta^{\circ} \\ \sin \theta^{\circ} & \cos \theta^{\circ}\end{array}\right)$
i.e. A rotation about the origin through an angle of (i) $90^{\circ}$.
(ii) $180^{\circ}$, (iii) $270^{\circ}$, (iv) -90 . Is
i) $\left(\begin{array}{cc}\cos 90^{\circ} & -\sin 90^{\circ} \\ \sin 90^{\circ} & \cos 90^{\circ}\end{array}\right)=\left(\begin{array}{cc}0 & -1 \\ 1 & 0\end{array}\right)$
ii) $\left(\begin{array}{cc}\cos 180^{\circ} & -\sin 180^{\circ} \\ \sin 180^{\circ} & \cos 180^{\circ}\end{array}\right)=\left(\begin{array}{cc}-1 & 0 \\ 0 & -1\end{array}\right)$
iii) $\left(\begin{array}{cc}\cos 270^{\circ} & -\sin 270^{\circ} \\ \sin 270^{\circ} & \cos 270^{\circ}\end{array}\right)=\left(\begin{array}{cc}0 & 1 \\ -1 & 0\end{array}\right)$
iv) $\left(\begin{array}{cc}\cos -90^{\circ} & -\sin -90^{\circ} \\ \sin -90^{\circ} & \cos -90^{\circ}\end{array}\right)=\left(\begin{array}{cc}0 & 1 \\ -1 & 0\end{array}\right)$

These matrices can also be obtained by rotating the unit square through these angles about the origin. The images of I and J when written in column form give the matrix of transformation.

## REFLECTION

## Matrices of reflection

if $(x, y)$ is reflected in the $y$-axis then, $(x, y)$ is mapped onto $(-x, y)$ In particular,

$\mathrm{I}(1,0)$ mapped onto $\mathrm{I}^{\prime}(-1,0)$
$\mathrm{J}(0,1)$ mapped onto $\mathrm{J}^{\prime}(0,1)$

The matrix of transformation is $\left(\begin{array}{cc}-1 & 0 \\ 0 & 1\end{array}\right)$.
If $(x, y)$ is reflected on the $x$-axis, then $(x, y)$ is mapped onto ( $x,-y$ )

Similarly, I(1,0) is mapped onto I,(1,0)
$J(0,1)$ is mapped onto $J^{\prime}(0,-1)$
The matrix of transformation is $\left(\begin{array}{rr}1 & 0 \\ 0 & -1\end{array}\right)$

Similarly,
The matrix of transformation for the reflection in $y=-x$, is
$\left(\begin{array}{cc}0 & -1 \\ -1 & 0\end{array}\right)$
Fory $=x$, is $\left(\begin{array}{ll}0 & 1 \\ 1 & 0\end{array}\right)$.
MATRICES OF TRANSFORMATION FOR ENLARGEMENT. In general the matrix of enlargement scale factor K and centre $O(0,0)$ is
$\left(\begin{array}{ll}K & 0 \\ 0 & K\end{array}\right)=K\left(\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right)$
The shape of the object and its image are similar

Linear ratio is $1: K$
Area ratio is $1: \mathrm{K}^{2}$
Therefore the area of the image $=K^{2} x$ the area of the object.

## Example:

$A^{\prime} B^{\prime} C^{\prime}$ is the image of a triangle $A B C$ with coordinates $A(-2,3)$, $B(2,6)$ and $C(5,3)$ respectively under an enlargement scale factor 5 . Show that the ratio of the area of triangle $A^{\prime} B^{\prime} C^{\prime}$ to the area of triangle $A B C$ is 25:1.

## Solution

Draw the object and its image on a Cartesian plan and find their areas.

## AREA AND DETERMINANTS

When the object and matrix of transformation are known, we can find the area of the image using the area of the object and the determinant.

## Example:

Rectangle $\mathrm{O}(0,0), \mathrm{A}(2,0), \mathrm{B}(2,1), \mathrm{C}(0,1)$ has been transformed through the following matrices of transformation.
i) $\left(\begin{array}{ll}3 & 0 \\ 0 & 3\end{array}\right)$
ii) $\left(\begin{array}{ll}2 & 0 \\ 5 & 3\end{array}\right)$
iii) $\left(\begin{array}{ll}1 & 2 \\ 4 & 0\end{array}\right)$ iv) $\left(\begin{array}{ll}3 & 4 \\ 1 & 2\end{array}\right)$

Use, Area of image = determinant $x$ area of object.
Therefore, Determinant = Area scale factor.
Note: The determinant can be negative but its absolute value is used.

## Example:

A rectangle with vertices $(0,0),(2,0),(2,3),(0,3)$ is transformed using matrix $\left(\begin{array}{ll}3 & 1 \\ 1 & 1\end{array}\right)$
i). Find the coordinates of the vertices of the image.
ii). Sketch the object and the image, Find the area of the image. Solution:
Object matrix $=\left(\begin{array}{llll}0 & 2 & 2 & 0 \\ 0 & 0 & 3 & 3\end{array}\right)$

$$
\left(\begin{array}{ll}
3 & 1 \\
1 & 1
\end{array}\right)\left(\begin{array}{llll}
0 & 2 & 2 & 0 \\
0 & 0 & 3 & 3
\end{array}\right)=\left(\begin{array}{llll}
0 & 6 & 9 & 3 \\
0 & 2 & 5 & 3
\end{array}\right)
$$

The vertices of the image $(0,0),(6,2),(9,5)$ and $(3,3)$.
ii) Area of the object $=2 \times 3=6$ square units.

Determinant of the matrix $=3 \times 1-1 \times 1=2$.
Therefore the area scale factor is 2 .
Therefore area of the image $=2 \times 6=12$ square units.

## Example:

Find the image of a unit a square under the transformation given by $\left(\begin{array}{ll}3 & 2 \\ 1 & 0\end{array}\right)$. Draw the diagram for the object and image and use it to find the area scale factor.
Solution:
From the diagram, image area $=2$ square units.
The area scale factor $=2$ but determinant $=-2$.
N.B

The area scale factor is equal to the magnitude of the determinant.

## Exercise:

The area of an object is $4 \mathrm{~cm}^{2}$. State the area of the image under the transformations given by the following matrices.
i) $\left(\begin{array}{ll}3 & 1 \\ 4 & 0\end{array}\right)$
ii) $\left(\begin{array}{cc}-1 & 2 \\ 3 & 0\end{array}\right)$
iii) $\left(\begin{array}{ll}5 & 3 \\ 2 & 4\end{array}\right)$
iv) $\left(\begin{array}{cc}-1 & 2 \\ 3 & -4\end{array}\right)$.

## SPECIAL CASES

a). When the determinant of a matrix of transformation is 1 , the area scale factor is 1 . So, the area of an object is the same as the area of its image. Transformations in which the area is invariant include; rotations, reflections, shears and translations. However, translations cannot be represented by a $2 \times 2$ matrix.

## Example:

1). A transformation is given $\left(\begin{array}{rr}-1 & 0 \\ 0 & -1\end{array}\right)$.

What is the area scale factor of a unit square under this transformation.
What are the coordinates of the image?
2). Find the area of the image of a unit square under a transformation given by $\left(\begin{array}{ll}1 & 3 \\ \frac{1}{3} & 1\end{array}\right)$..

## Solution:

Determinant $=1 \times 1-3 \times \frac{1}{3}=0$
Therefore, Area scale factor $=0$
In fact the image is a line segment, so the area is 0 .
Shearing:
The determinant of the matrix for any shear is 1 , since the area property of shearing is that it is invariant.

The matrix of a shear with the x -axis invariant is, $\left(\begin{array}{ll}1 & k \\ 0 & 1\end{array}\right)$. With the y -axis, invariant is $\left(\begin{array}{ll}1 & 0 \\ k & 1\end{array}\right)$.
N.B Sketch the image of the unit square when the matrix of transformation is $\left(\begin{array}{ll}1 & 3 \\ 0 & \frac{1}{3}\end{array}\right)$.

Explain from the figure why this transformation is not a shear. What is the area of the image?
What is the value of the determinant?
Solution:
The x -axis is an invariant line, but the points J and K have not moved parallel to this invariant line.
The area of the image $=\frac{1}{3}$ sq. units
The determinant is $\frac{1}{3}$ and so the area scale factor is $\frac{1}{3}$ thus the area is not invariant as it would be under a shear.

Note:
If the x -axis is invariant, for any shear, then the points J and K have to move parallel to this invariant line. Similarly, if the $y$ axis is invariant, the points $J$ and $K$ have to move parallel to this line.

| Transformation | matrix | symbol |
| :--- | :--- | :--- |
| Positive quarter turn about O | $\mathrm{R}=\left(\begin{array}{cc}0 & -1 \\ 1 & 0\end{array}\right)$ | R |
| Half turn about O | $\mathrm{H}=\left(\begin{array}{cc}-1 & 0 \\ 0 & -1\end{array}\right)$ | H |
| Negative quarter turn about O | $\mathrm{Q}=\left(\begin{array}{cc}0 & 1 \\ -1 & 0\end{array}\right)$ | Q |
| Reflection in x-axis | $\mathrm{X}=\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right)$ | X |
| Reflection in y -axis | $\mathrm{Y}=\left(\begin{array}{cc}-1 & 0 \\ 0 & 1\end{array}\right)$ | Y |

| Reflection in line $\mathrm{y}=\mathrm{x}$ | $\mathrm{M}=\left(\begin{array}{cc}0 & 1 \\ 1 & 0\end{array}\right)$ | M |
| :--- | :--- | :--- |
| Reflection in line $\mathrm{y}=-\mathrm{x}$ | $\mathrm{N}=\left(\begin{array}{cc}0 & -1 \\ -1 & 0\end{array}\right)$ | N |
| Identity | $\mathrm{I}=\left(\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right)$ | I |

IMAGES OF LINES UNDER A MATRIX OF TRANSFORMATION.
A line is a set of points so, to find its image under a given matrix of transformation, get at least two points on the line. Use the points to form a coordinates matrix.

## Examples:

Find the images of the lines;
i) $3 x+2 y=-6$
ii) $Y=4 x+12$

Under the following transformations.
a). $1 / 4$ turn, center $(0,0)$.
b). a reflection in line $\mathrm{y}=\mathrm{x}$.
sketch the objects and their images on the same diagram.

## Exercise:

1). Find the image of the line $y=-2 x+4$ when reflected in the $x-$ axis then in the line $y=x$. Sketch the two lines.
2). Sketch the image of the line $2 y+5 x=10$, when it is reflected in the line $y+x=0$; then rotated through a positive turn about the origin.
